November 10, 2020 - Proposal Meeting

TSC Proposal Meeting

Participants

Notes

As we didn't have full TSC we decided to push the actual voting till next meeting

Composition Service

Some lively discussions here. This is what was concluded.

- Composition service needs to align with Redfish Spec
- If a newer model is adopted that is not yet in the spec it will have to live in its own branch
- It is okay to have a self-contained service in a non-Golang language but integration of base services have to happen
- It needs to be reached via the same API Gateway

As the current proposal suggests a contribution that is based on RSD it is not inline with the above conclusions

Other

- The BMC Simulator has already been approved in an earlier meeting so that will change to approved stated in the list
- The White Paper "Support for data center fabric" will be split into two different papers. This proposal is therefore on hold
- Dell plugin. It appears nobody has much concerns about this contribution. A vote will happen next meeting.
